FIELDS OF INTEREST

Economics of Education, Labor Economics, Public Economics

JOB MARKET PAPER

[“The Long Shadow of School Closures: Impacts on Students’ Educational and Labor Market Outcomes”](#), Media Coverage: [EducationWeek](#)
Experiencing school closures lowers educational attainment and earnings in adulthood.

WORKING PAPERS (ABSTRACTS AT END)

[“The Racial Gap in Friendships Among High-Achieving Students”](#) (with Weonhyeok Chung)
High-achieving minority students have fewer friends mainly because of fewer high-achieving peers within their own race, which contributes to the racial earnings gap.

[“From Population Growth to Demographic Scarcity: Emerging Challenges to Global Primary Education Provision in the Twenty-first Century”](#) (with Emily Hannum, and Fan Wang)
Demographic trends shape the challenge of primary education provision in disparate ways around the world.

[“Low Psychic Costs of Education for Women and the Gender Wage Gap”](#)
Differential education sorting based on multiple skills accounts for a part of the gender wage gap.

WORK IN PROGRESS

[“Neighborhood Impacts on STEM Choice”](#)
Neighborhoods where students grow up shape their choice of college major and career.

[“The Long Shadow of School Closures: Impacts on Students’ Educational and Labor Market Outcomes”](#)

Abstract: Each year, about a thousand public schools in the US close, displacing hundreds of thousands of students. I examine the impact of public school closures on displaced students using linked schooling and labor market data from Texas. I first document that most public school closures are driven by declines in the school-age population. I implement difference-in-differences strategies using the within-school across-time/cohort variation in student exposure to school closure. I find that school closures decrease test scores, increase absenteeism, and lead to more disciplinary actions. Furthermore, I find that school closures decrease high school completion, college attainment, employment, and earnings at ages 25-27. These impacts are larger for secondary school students, Hispanic students, and those from economically disadvantaged backgrounds. This research highlights the far-reaching consequences of school closures and emphasizes the need for careful policy consideration in educational restructuring.

[“The Racial Gap in Friendships Among High-Achieving Students”](#) (with Weonhyeok Chung)

Abstract: High-achieving minority students have fewer friends than their majority counterparts. Exploring patterns of friendship formation in the Add Health data, we find strong racial homophily in friendship formations as well as strong achievement homophily within race. However, we find that achievement matters less in cross-racial friendships. As a result, high-achieving Black students lose Black friends as they move away from the mean achievement of their group, but do not gain high-achieving White friends in offsetting fashion. We find that high-achieving Black students have fewer friends, mainly due to the fact that they are exposed to fewer high-achieving peers within their own race. Estimating causal returns to friendship, we find that this could account for as much as 5–9 percentage points (16-33%) of the racial earnings gap observed among high achievers.

[“From Population Growth to Demographic Scarcity: Emerging Challenges to Global Primary Education Provision in the Twenty-first Century”](#) (with Emily Hannum, and Fan Wang)

Abstract: Demographic trends shape the challenge of primary education provision in disparate ways around the world. In some societies, ever-increasing child cohorts continue to exert expansionary pressures. In others, declining child cohorts create pressures for system consolidation. We show that recent demographic trends constitute a highly dis-equalizing force on primary educational provision globally, with persistent expansionary pressures affecting some of the world’s least-resourced educational systems. Strikingly, in recent decades, system responses to demographic pressures have produced a converging trend in child-teacher ratios while generating distinct patterns and trends in school size. Ultralow-fertility Korea offers a stark illustration of the emerging salience of rural-urban spatial hierarchies. Demographic pressures and associated policy responses constitute an essential yet neglected research agenda for understanding global educational inequalities.

[“Low Psychic Costs of Education for Women and the Gender Wage Gap”](#)

Abstract: In recent years, women have surpassed men in terms of schooling, leading some researchers to propose that women may have lower psychic costs of attending school. To understand the implications of this, I incorporate psychic costs explicitly into the Becker model of human capital. The model generates predictions about differential sorting into college and gender gaps in skills, education, and wages, which I investigate with data from the NLSY97. I find that women have lower psychic costs—measured by behavioral misdemeanors—which explains one-third of the gender college attainment gap. While women in the population have higher cognitive skills, this is reversed when controlling for educational level because of the differential education sorting. Given that the returns to cognitive skills are higher than the returns to good behavior in the labor market, I find that accounting for skill mix explains 7-12 percent of the gender wage gap among the college-educated in the NLSY97.

WORK IN PROGRESS “**Neighborhood Impacts on STEM Choice**”

WITH ABSTRACTS *Abstract:* I show that the neighborhoods where students grow up significantly influence their choice of STEM by using variation in the grades at which students move across districts and counties in Texas. Students moving to high STEM areas—measured by the proportion of non-moving students obtaining a STEM degree—show a linear increase in their probability of selecting a STEM major with the time spent in the new place. To distinguish the causal effects of neighborhoods from confounding factors, I exploit sharp variations in predicted neighborhood effects across school cohorts, genders, races, and specific college majors. The tests also suggest that the observed exposure effects are not merely due to an overall improvement in educational attainment. Importantly, I find that the STEM exposure measure is strongly tied to occupational composition. Lastly, I find that the positive effects extend to students from both disadvantaged and non-disadvantaged families.
